

Justify full year (1400 hrs)

Main objective: Offer technical support and assistance in enhancing GIA HK analytic capabilities

- Explore the use of advanced technology (e.g. AI)

- Support the key audits and other engagements in 2027:
 - Individual Life Claims (Audit)
 - Premium Collection (Audit)
 - Post-sales call analytics (CM)
 - Complaint handling (RM)

- Automation of manual audit test steps
 - Automate the data extractions (e.g. internal/external data source)
 - Establish data pipeline
 - As foundation for continuous auditing
 - One of the sample test case under development:
 - Automate the validates medical service providers on claims receipts against official regulator listings

- Exploratory Proof of Concepts (PoC)

- Assist HK DA team to support Group AotF workstream

- Exploratory of Databricks AI capability - Genie Space
 - Pilot workgroup with Group AAT and Singapore DA teams
 - No code environment for business auditor to perform data queries and simple analysis using natural language

- Maintain and enhance the existing platform / tools (e.g. databricks, SandBox)

Achievement from Internship (Jan – Sep 2026):

AI Applications

- MedVerify: Developed an AI-powered audit tool that validates medical service providers on claims receipts against official regulator listings to identify potentially suspicious cases and reduce manual verification efforts.
- Welcome Call UI: Developing a user-friendly interface for the Post-Sales Call Analytics AI solution, enabling non-technical auditors to easily run analyses and access insights independently.
- Regulatory Compliance Automation:
Across IA, BMA and AMCM alone, auditors may need to review about 259 regulatory documents. The automation helps by:
 - finding and downloading the documents automatically
 - identifying relevant audit and assurance requirements
 - showing the exact page and supporting text
 - producing a structured Excel for reviewThis saves auditors from manually searching through hundreds of documents.

Local Desktop Tools

- SecureSheet: Developed a desktop tool that automates data masking and AES-256 encryption/decryption of sensitive spreadsheet data, helping auditors securely handle confidential information during audits.
- DataCheck: Developed a data quality validation tool that automatically identifies issues such as missing values, duplicates, invalid formats, and out-of-range data, improving the accuracy and reliability of audit datasets.
- Relationship Mapper: Developed a relationship analysis tool that maps and analyzes connections between datasets, helping auditors identify data linkages, anomalies, and coverage gaps more efficiently.

How CW more favorable than TSS / DNA engagements?

- Security and access rights concern
- Less regulatory constraints – transfer data out of HK/Macau boundary
- More flexible on project time and task assignments
- Retention of knowledge within GIA
- Less costly ?
- Experience on GIA projects / engagements / methodology and training / understanding on local business processes / regulatory requirements obtained during the internship
